

Executed functions after having received the image.

Unshared the execution context, isolating the children of this process into a new mount and PID namespaces.

The `orted-restore` forks itself and the parent ends its execution. The child is now in the new namespace and can continue the execution.

Umount the old `/proc` mountpoint.

Mount the new `/proc` mountpoint, reflecting the new namespace resources.

Mount the `devpts` pseudo-filesystem.

Mount the `/dev/ptmx` pseudoterminal master. This mountpoint is used by Open MPI for I/O and it requires to be remounted.

Eventually, the restart of `orted` via `CRUIU` API call is performed.

The execution of migrated `orted`.

End of program and close ssh session.
